# Converting India's Vehicles to Electric by 2030

Ashok Jhunjhunwala, IIT Madras, ashok@tenet.res.in

#### India Recognises

- India imports most of its oil impacting its economy badly
  - It has 14 of 20 most polluted cities in the world
  - EV is the future: four times higher energy efficiency and 50% less moving parts
- India's vehicles different from that in most of the world
  - 79% two-wheelers, 5% Autos and e-rickshaw, 3% Buses and large goods vehicle
  - 12% Economy Cars (< \$13000) and 2% Premium Cars ( > \$13000)
  - 98% of public and affordable vehicles: not the focus of the rest of the world; India could attempt to get leadership here
- India has low affordability and can afford minimal subsidy
  - EV must make business sense: How?
  - Battery contributes to 50% of costs
    - falling rapidly over last five years but still expensive

## Strategy for EVs for Public Transport

- Higher efficiency Wh/km (kms/litre of petrol) reduces battery size, weight and costs
  - For e-autos in last one year: from 70 to 80 Wh/km to 45/50 Wh/km
  - E-buses: from 1600 Wh/km to 900 Wh/km
- Split battery into smaller size (one third) and swap
  - No waiting time to charge battery: no public infrastructure required
- Battery-life severely affected by Fast Charging at 45 deg C
  - Swapped battery can be charged in conditioned environment and in two hours to maximise its life
- Separate vehicle business (without battery) & energy business (battery)
  - Capital cost similar to that for petrol / diesel vehicle
  - Operation cost today same as petrol / diesel vehicle
    - WITH no SUBSIDY; but lower GST for strictly three years
- Drive volumes aided by Public procurement

#### EV Strategy for Private Transport (2/4-wheelers)

- Batteries dominate the cost of an EV (Tesla uses battery for 540 kms)
  - and also vehicle weight (reducing the energy efficiency or kms/kWh)
  - Smaller battery creates range anxiety
    - Use Public Fast Charger: waiting time + public charging infrastructure: takes an hour to charge battery
    - Fast Charge in 15 to 20 minutes: needs expensive batteries (life impacted as temperature crosses 40°C)
- Suppose EVs have a small low-cost battery with limited range built-in: Affordable
  - Example: 100/ 50 km range for e-car / e-scooter: Enough within cities for 90% of days
  - Use only night-time Slow Charging: maximising battery life
- When one needs to drive longer distances (10% of days)
  - use a RANGE EXTENDER battery to overcome range anxiety
    - Swap-in a second (swappable) battery doubling the range at a petrol pump (3 to 5 minutes)
    - Swap the swappable battery again for still longer range (300 kms or 400 kms)

### **Strategy for EV Batteries**

- Battery pack development: thermal design, mechanical design and Battery Management
  System to get the best out of low-cost cell: largely ready
  - established and start-ups [30-35% value add]
- Battery Cell Development
  - JV with external tie-ups [30% value add]
- Battery Material Development: great progress with battery recycling (urban mining) [40% value add]
  - scaling on way

Cell to Pack Manufacturing

2017 – some 15 companies

### Summing up: India's Tasks

- 1. Most Energy Efficient Vehicles: low Wh/km will reduce the size of the battery
  - Better motor and drive (power-train), better tyres, lower weight and better aerodynamics
- 2. Battery ecosystem: Pack manufacturing (30-35%), cellmaking (30%), materials and chemicals (40%)
- 3. Charging and swapping Infrastructure for range-extension
  - Slow-charging, fast charging and battery swapping
- 4. Demand Generation and Policies

#### Vehicles on Drive Pilot with Battery swapping at CBEEV, IITM Campus

#### Test vehicle with school kids, residents and staff in IITM campus

December 2018

Accelearting ClenTech Ecosystem

- India needs innovative approa
  - Or will be flooded by imports i
- Time is of essence

- Vehicles: Ashok Leyland, Tata Motors, Mahindra, Eicher, Bajaj, Kinetic, Lohia, Electrotherm, Goenka, Hero-Eco, Okinawa, Ather, Avon Cycles, TVS Motors
- Li lon Battery and recycling: Exide, Amar Raja, Exicom, ACME, Grintech, Greenfuel, Ion Batteries, Attero, Sun-mobility
- Energy Operators: Essel Infra, Sun-mobility, BPCL, NTPC, PGCIL, Kerala DISCOM, Goldstone
- Chargers, Motors and Monitoring: Delta, ACME, Exicom, TVS Motors, Esmito
- Most State Governments, STUs
- Several industries and start-ups have worked hard over the last few years
  - They need to be encouraged and see a continuous forward movement
- More focus on Make in India and start-ups and R&D institutions
  - With attempts to preserve India's GDP and grow jobs
- Can we do it by 2030: Certainly

For deeper understanding, look at the blog "understanding the EV Elephant": <u>https://electric-vehicles-in-india.blogspot.in/2017/12/</u>
